Program 2 GDB Write-up

Implementing program 2 was little easier than program 1 and I think it is because of the power of dynamic binding. I think program 1 was very difficult because I did not have enough knowledge and skill but I had to program it in an object oriented way. While I was doing my second programming assignment, I felt if I knew about dynamic binding earlier, program 1 would have been a lot easier. I still do not fully understand what object oriented programming is but it is slowly making sense. There were some moments where I faced segmentation fault and double free error when I tried some testing and I figured it out with gdb backtrace. I still do not know a lot about gdb and its commands and so I may need more study and practice on how to use gdb.
